

YDD

APRIL 22

Why vanilla ?

Problem with learning only a framework - not understanding the foundations

PHP 8

24 hour

OOP

Custom Framework

Custom Template engine

Routing

Containers & dependency
injection

MySQL and MariaDB

Security

Registration & authentication

CRUD

File handling

Deployment

Description	Amount	Receipt(s)	Date	Actions
Test	25.00		2024-04-23	
some stuff	565.00		2024-04-05	
The third	25.00		2024-04-24	

Application

```

└─ App
    ├── Config
    ├── Controllers
    ├── Exceptions
    ├── Middleware
    ├── Services
    ├── views
    ├── bootstrap.php
    ├── container-definitions.php
    └── functions.php
```

Custom Framework

```

└─ Framework
    ├── Contracts
    │   ├── MiddlewareInterface.php
    │   └── RuleInterface.php
    ├── Exceptions
    │   ├── ContainerException.php
    │   └── ValidationException.php
    ├── Rules
    │   ├── DateFormatRule.php
    │   ├── EmailRule.php
    │   ├── InRule.php
    │   ├── LengthMaxRule.php
    │   ├── MatchRule.php
    │   ├── MinRule.php
    │   ├── NumericRule.php
    │   ├── RequiredRule.php
    │   └── UrlRule.php
    ├── App.php
    ├── Container.php
    ├── Database.php
    ├── Router.php
    ├── TemplateEngine.php
    └── Validator.php
```

Benefits:

Containers & dependency injection

```
<?php

declare(strict_types=1);

namespace Framework;

use Framework\Exceptions\ContainerException;
use ReflectionClass, ReflectionNamedType;

You, prieš 5 dienas | 1 author (You)
class Container
{
    private array $definitions = [];
    private array $resolved = [];

    public function addDefinitions(array $newDefinitions)
    {
        $this->definitions = [...$this->definitions, ...$newDefinitions];
    }

    public function resolve(string $className)
    {
        $reflectionClass = new ReflectionClass($className);

        if (!$reflectionClass->isInstantiable()) {
            throw new ContainerException("Class {$className} is not instantiable");
        }

        $constructor = $reflectionClass->getConstructor();
```

SQL and MariaDB

```
public function edit(array $formData, int $id)
{
    $formattedDate = "{$formData['date']} 00:00:00";

    $this->db->query(
        "UPDATE transactions
        SET description = :description, amount = :amount, date = :date
        WHERE id = :id AND user_id = :user_id",
        [
            'description' => $formData['description'],
            'amount' => $formData['amount'],
            'date' => $formattedDate,
            'id' => $id,
            'user_id' => $_SESSION['user']
        ]
    );

    You, prieš 26 minutes • before files section
    public function delete(int $id)
    {
        $this->db->query(
            "DELETE FROM transactions
            WHERE id = :id AND user_id = :user_id",
            [
                'id' => $id,
                'user_id' => $_SESSION['user']
            ]
        );
    }
}
```

Middleware

```
<?php You, prieš 9 valandas • before crud

declare(strict_types=1);

namespace App\Middleware;

use Framework\Contracts\MiddlewareInterface;
use Framework\TemplateEngine;

You, prieš 9 valandas | 1 author (You)
class CsrfTokenMiddleware implements MiddlewareInterface
{
    public function __construct(private TemplateEngine $view)
    {
    }

    public function process(callable $next)
    {
        $_SESSION['token'] = $_SESSION['token'] ?? bin2hex(random_bytes(32));

        $this->view->addGlobal('csrfToken', $_SESSION['token']);

        $next();
    }
}
```

Whats next?

1. Finish the course

2. Build PHP API

3. Learn a Framework
